

CSols laboratory systems integration

1 CSols analyses the data systems that exist within each laboratory environment, helping laboratories to choose the right systems and optimizing the performance of each.

- analytical instruments,
- laboratory data management systems - e.g. laboratory information management systems (LIMS), Scientific Data Management Systems (SDMS), Electronic Laboratory Notebooks (ELN), Chromatography Data Systems (CDS))
- enterprise applications - e.g. e-mail, document management systems and enterprise resource planning (ERP) -

2 CSols provides the analytically focused software and technology needed to integrate any laboratory data systems, repositories, analytical instruments and higher level enterprise business systems.

3 CSols truly automates the analytical processes that are ordinarily undertaken manually, using a customer driven, hands-on approach to ensure that systems, intersystem processes and personnel, all operate together as a rational whole.

4 CSols' multi-disciplinary team of chemists, IT analysts and regulatory specialists look beyond the technology to gain a clear understanding of how each laboratory operates, providing the expertise, products and services required to maximise quality and return on investment.
